

## Case history Large radio station (Northern country)

A non disclosed Northern European broadcaster was looking for a central router that serves many existing mixers. Mandozzi realized a fully redundant router with 15 concentrators installed in the various studios to connect the mixers.

The concentrators are connected to the router via redundant optical fibres. Every studio is equipped with a PC that controls that part of the router that corresponds to the lines of this studio ("virtual router").

The access rights of all the control PCs are allocated by the router supervisors.
